

Understanding Children on the Autism Spectrum: **A Guide for First Responders**

Finding and safely recovering a missing child on the autism spectrum can present unique challenges for caregivers, families, first responders, and search teams. The National Center for Missing & Exploited Children® (NCMEC) continually works to raise awareness related to children on the autism spectrum because of the rate that they go missing and are recovered deceased due to accidental deaths such as drowning in bodies of water. NCMEC's recommendations for how law enforcement can best support these children are based on what we have learned about autism spectrum disorder.

Definition

Autism spectrum disorder (ASD) is a developmental disability that can cause significant social, sensory, communication, and behavioral challenges, and some children with ASD may also have co-occurring intellectual disabilities. As a result of a variety of factors, these children may communicate, interact, behave, learn, or respond in ways that are different from children who are not on the autism spectrum. Their learning, thinking, and problem-solving abilities can range from needing a lot of support to needing less support in their daily lives. ASD is an umbrella term used to describe several conditions that were previously diagnosed separately: autistic disorder, pervasive developmental disorder not otherwise specified (PDD-NOS), and Asperger syndrome.

In most instances, NCMEC uses the phrase "children on the autism spectrum" because it centers us around the vulnerabilities law enforcement and others need to consider when responding to missing child incidents. It also helps responders remember the broad "spectrum" of characteristics and behaviors this population of children might exhibit. No two individuals are ever alike, and children on the autism spectrum are no exception. Indeed, there is a reason the medical community has included the word "spectrum" in the modern definition.

Characteristics & Behaviors

While the individuality of children on the autism spectrum is important to underscore, there are some characteristics and behaviors law enforcement partners should understand regarding searching for and helping to keep these children safe. For example, a child on the autism spectrum **may**:

- Go missing from their environment at a rate higher than other children
- Be non-speaking/non-verbal or non-responsive when their name is called by searching parties
- Exhibit a diminished sense of fear or engage in high-risk behavior, such as seeking water or active roadways
- Elude or hide from search teams
- Seek small or tightly enclosed spaces
- Have meltdowns or exhibit an intense emotional response
- Heightened risk of exploitation due to their disability

The Centers for Disease Control and Prevention describes “wandering” as someone leaving a safe area or a responsible caregiver, and it typically includes situations where the child may be injured or harmed as a result. Other terms used to describe this behavior are elopement, bolting, fleeing, or running. The bottom line is when these events happen **a child is missing**, and their life or well-being may be in danger. Studies indicate that half of children on the autism spectrum go missing at some point during their life – a rate nearly four times higher than other children – and these children often seek bodies of water, such as streams, ponds, lakes, rivers, creeks, storm-water retention/detention basins, or swimming pools. This phenomenon is not entirely understood, but researchers and professionals studying this issue believe children on the autism spectrum may seek the serenity bodies of water can offer to relieve their anxiety.

Research also indicates children on the autism spectrum are 160 times as likely to die from drowning as the general pediatric population. Furthermore, in a 10-year analysis from 2011 to 2020, 1,516 children on the autism spectrum were reported missing to NCMEC. That report showed that 4% of reported missing children with ASD were recovered deceased, and in 70% of those cases, the manner of death was classified as accidental; 84% of which were drownings.

This population of children may not speak or have difficulty with verbal communication and in some cases may not be able to respond to their name. They may elude searchers, sometimes concealing themselves in small or tight spaces, and may display a diminished sense of fear about dangers in their surroundings. In addition to immediate threats such as water or traffic, they may travel to low-sensory areas such as the woods, abandoned vehicles, or trains, which can pose dangers.

It is also important to understand that, despite the best efforts of parents and caregivers, these children can quickly be outside of their control – even locked homes. The characteristics and behaviors of these children are important for law enforcement to learn about so that there is a broader understanding of what the reporting caregiver may be experiencing. Rather than immediately viewing a caregiver as careless or reckless because their child is missing, it is recommended that the response is geared toward de-escalation, support, and recovery.

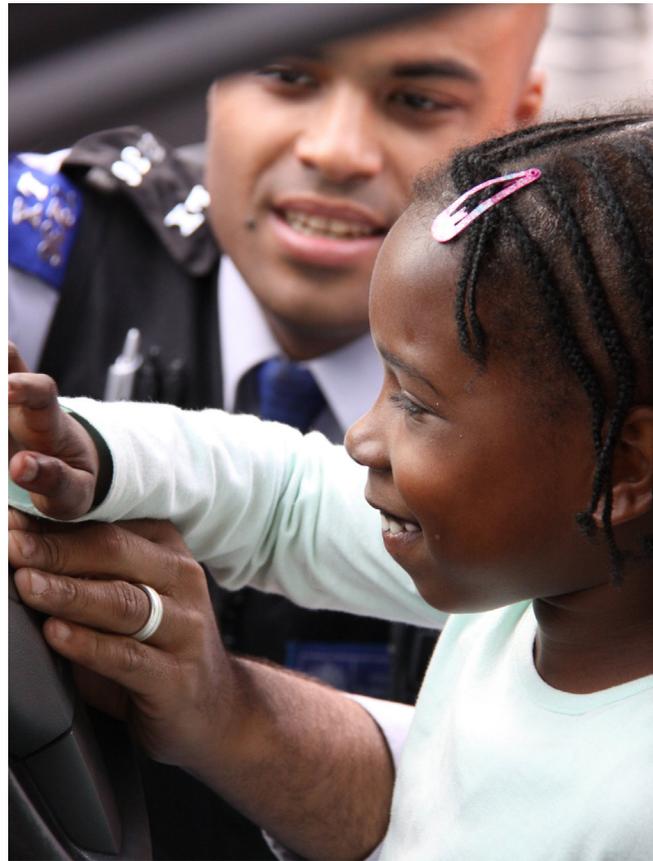

Building Awareness Through Community Partnerships

NCMEC's recommendation for ensuring safe interactions and swift recoveries for children on the autism spectrum is that of a whole community approach. This includes training for law enforcement officers and public safety telecommunicators, support for caregivers, community partnerships, and leveraging available technology and tools. Core components of outreach and awareness that you can consider as a leader in your community are to:

1. Consistently train your officers on search and response protocols for children on the autism spectrum and other populations in your community who may frequently go missing.
2. Engage community stakeholders and leverage existing relationships to build awareness, understanding, and support.
3. Utilize available technological solutions so that responders immediately have key information in the event a child goes missing.

One of the simplest ways to provide a long-term and comprehensive approach to supporting children on the autism spectrum and their caregivers is to leverage existing community partners and stakeholders. NCMEC and nationally recognized law enforcement experts who have created outreach and awareness programs in their communities strongly recommend collaborating with existing organizations such as local non-profits and government agencies that provide adult and child protective services, schools, and fire and rescue. This is important because it builds community understanding, increases lines of communication, and provides innovative solutions when resources are scarce.

Utilizing Technological Solutions

Another proactive measure that law enforcement agencies can take is setting up safe and secure electronic information systems identifying the populations in their community that may have a higher rate of going missing. These voluntary programs allow members of the community to sign up a dependent or loved one with local law enforcement agencies so officers can access data with pertinent information about the child during critical times. The goals of these programs are to promote communication and give field personnel immediate access to relevant information about the enrolled individual, saving time and promoting the safety of the individual during the contact. When making resource decisions, keep in mind that these programs can support not only families with children with intellectual or developmental disabilities such as ASD, but also other populations that may go missing such as individuals with Alzheimer's or Dementia.

Locative technology is another resource that can be considered. These allow for the tracking of the location of the child who is wearing the device. Concerns over lack of service, battery and charging failures, removal of the devices, and not working in water are among some of the issues that caregivers and law enforcement should consider with regard to the use of locative technology. From NCMEC's perspective, locative technology should be viewed as one tool in the toolbox for caregivers and law enforcement, and by no means the only one, particularly due to not only the technical vulnerabilities, but also the lack of access that caregivers may have to these devices. NCMEC does not endorse any specific type of locative technology but encourages caregivers to make informed decisions about whether these devices may be helpful for their children.

Through the *Kevin and Avonte Program: Reducing Injury and Death of Missing Individuals with Dementia and Developmental Disabilities*, The International Association of Chiefs of Police (IACP) supports local jurisdictions' efforts to reduce the number of deaths and injuries of individuals with developmental disabilities such as autism spectrum disorder who go missing. An examination of the use of technology is a part of this effort.

Search Protocols

Because of the high mortality rate documented by NCMEC and other research entities, it is recommended that law enforcement treat incidents where children on the autism spectrum go missing as **critical** incidents requiring an elevated response. NCMEC has a free downloadable **Search Protocols & Questionnaire for First Responders** that can be referenced, and below are additional considerations for law enforcement.

The higher-than-average missing rate, coupled with attractions to water or other unsafe sites such as trains, can contribute to fatal outcomes. Accordingly, it is recommended that first responders **immediately search bodies of water** – and stay there – even if it is unknown whether the child is attracted to water.

Responders should **quickly identify the unique interests** of the child and create a list of their favorite people or places. Talk to the parents, siblings, relatives, caregivers, and others who know the child well to ask for information about interests, fascinations, stimulations, or obsessions when developing search plans and determining where the child may go. This information could be the key to a successful recovery.

NCMEC also recommends that searches should be extended as we have assisted in cases where a child on the autism spectrum was recovered alive after several days of being missing and exposed to the elements outdoors.

As with all critically missing children, time is a vitally important factor in a safe recovery. Law enforcement agencies are encouraged to **contact the National Center for Missing & Exploited Children® at 1-800-THE-LOST® (1-800-843-5678)** for free technical assistance and resources, including search and rescue experts who may be able to immediately deploy to help find the child.
